DETAILED ACTION

1. Claim 10 has been cancelled.
2. Claims 1-9 and 11-41 are pending.

Response to Arguments

1. Applicant's arguments filed 22 October 2008 have been fully considered and they are persuasive.

Allowable Subject Matter

2. Claims **1-9 and 11-41** are allowed.
3. The following is an examiner's statement of reasons for allowance: The present invention is directed toward a system and method for decrypting all encrypted data packets captured from at least one of a plurality of access points in a wireless network. Each independent claim identifies the uniquely distinct features **"a single keyset profile stored in a data store, said single keyset profile having a plurality of encryption keysets, each encryption keyset being used to decrypt encrypted data received from a different access point of said at least two wireless access points"**.

The closest prior art, Fontana et al. (Pub No. 2003/0120605) discloses a method and system for protecting software from unauthorized use on a computer system using an external security device is disclosed. The method and system include encrypting the software to be protected using an encryption key. The use of the software on the computer system is then authorized by generating the encryption key within the security device using information supplied from the software. Once the encryption key generated

by the security device is received on the computer system, the encryption key used to decrypt the encrypted software for execution on the computer system.

However, either singularly or in combination, Fontana et al. fail to anticipate or render obvious a plurality of encryption keysets, each encryption keyset being used to decrypt encrypted data received from a different access point nor disclose a data store that stores the different encryption keysets in single keyset profile wherein said keyset profile is used to decrypt all of said captured encrypted data received from said plurality of wireless access points.

The closest prior art, Nyman et al. (Pub No. 2003/0037033) discloses a naming distribution method for ad hoc networks wherein device name conflicts are resolved when adding devices to existing ad hoc networks or when joining two ad hoc networks together. After a connection has been established between a new device to be added and a first member device in the ad hoc network, a name distribution message is transferred by the new device to the first member device. The name distribution message will be passed from member device to member device in the ad hoc network, and at each member device a name conflict check is performed. Device name conflicts are also resolved when joining two ad hoc networks together. The contents of name manager tables of the two respective ad hoc networks must be exchanged. This is accomplished by forming a name distribution message for each name record in the name manager tables of the two devices establishing the connection on behalf of their respective ad hoc networks. Then the name distribution messages formed in each respective ad hoc network are distributed to the other ad hoc network. In the process of

distributing the name distribution messages through the other network, any name conflicts are commonly resolved in all of the devices in both ad hoc networks.

However, either singularly or in combination, Nyman et al. fail to anticipate or render obvious a keyset profile having all keysets being used by any of said at least two access points nor a plurality of encryption keysets, each encryption keyset being used to decrypt encrypted data received from a different access point.

4. Therefore, **claims 1, 15, and 25**, and the respective **dependent claims 2-9, 11-14, 16-24, and 27-41** are in condition for allowance.

Conclusion

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
